

ThatFridge

App Review Guide for Apple App Review

This document supplements the *App Review Information* notes and demo account in App Store Connect. Its purpose is to answer likely review questions up front and prevent avoidable review cycles.

1. At a glance

App name	ThatFridge
Bundle ID	<code>test.thatfridge.app</code>
Version	1.3.0 (build number auto-incremented by EAS)
Platform	iOS only, iPhone; minimum iOS 15.1
Category	Food & Drink
Age rating	9+
Primary market	Malaysia at launch (plus ~140 other storefronts); South Korea is a post-approval fast-follow. English-language UI.
Account	Required for full use — demo account provided below
In-app purchases	One auto-renewable subscription (<i>ThatFridge Pro</i> , 7-day free trial) and three consumable “AI credit” packs (<code>credits_100</code> , <code>credits_500</code> , <code>credits_1500</code>). See §5.
Third-party login	Sign in with Apple (native) and email/password; Google Sign-In where available
Backend	Live production REST API at <code>api.thatfridge.com</code> (hosted in Singapore)
Advertising / tracking	None. No ad SDK, no analytics SDK, no tracking.

2. What ThatFridge does

ThatFridge is a household food-inventory app. Users track what is in their fridge, freezer and pantry; the app sends expiry reminders and an AI “crew” of four assistants — **Chef**, **Guardian**, **Organizer** and **Shopkeeper** — suggests meals from current stock, flags food about to spoil, advises on storage, and builds a shopping list. A household can share one fridge so every member sees the same live inventory.

Every AI action — a chat message, a receipt or fridge-photo scan, generating a food icon — spends “AI credits” from a monthly balance. Every account gets a free monthly allowance; *ThatFridge Pro* grants a much larger monthly bundle and lets the user host a shared fridge for their household. Anyone can also buy one-off credit packs. Barcode scanning and manual entry are always free and never use credits.

3. Demo account and sign-in

Email	<code>keira@thatfridge.test</code>
Password	As entered in the <i>App Review Information</i> → <i>Sign-In</i> Required fields in App Store Connect

- Launch the app → the **Sign in** screen → enter the credentials above → **Sign In**. No email verification, no two-factor step, and no invitation code is required.
- On first sign-in a short 3-slide intro carousel appears. It is skippable — tap **Skip** (top-right) to go straight to the app.

- The account is pre-populated: shared fridges with items across all three storage zones (fridge, freezer, pantry) and a recipe book with sample recipes. Every screen has real content on first launch — there are no empty states to work around.
- **The demo account has ThatFridge Pro active and a large AI-credit balance**, so every feature — receipt/photo scanning, hosting a shared fridge, and the AI crew — is available without any purchase. To review the purchase flows themselves, see §5.
- Alternatively, **Sign in with Apple** on the same screen creates a fresh account with no data (free tier, 50 AI credits).

4. Guided walkthrough

1. **Home tab.** The four crew members, a Kitchen Score, the fridge image carousel, and “crew tip” cards generated from the seeded inventory (e.g. an item near expiry, a low-stock item, a recipe suggestion).
2. **Inventory tab.** The full item list grouped by storage zone. Tap any item for its freshness percentage, expiry date, quantity and notes. Freshness colour: green = fresh, amber = due soon, red = overdue.
3. **Add (centre “+” button).** Four ways to add stock: *Scan barcode* and *Add manually* are always free; *Scan receipt* and *Photo of fridge* each spend AI credits (the demo account has plenty). Each method is labelled with its credit cost. The camera methods open the camera directly, with an “upload from library” option for testing without a physical receipt or fridge.
4. **Chat tab.** Ask the crew in plain language, e.g. “what can I cook tonight?”. Each message spends one AI credit (three when the crew acts on the fridge); the running balance and a “Get more” link sit under the composer. The crew can also read and act on the user’s own kitchen when asked (add an item, tick off the shopping list, leave a note) — destructive actions ask for confirmation first. Responses are produced server-side (see §8).
5. **Crew tab.** One panel per assistant: Chef (recipes ranked by expiry), Guardian (food-safety flags), Organizer (storage guidance and a “misplaced items” sweep), Shopkeeper (shopping list and “don’t rebuy” hints).
6. **Recipes** (from Home or Crew → Chef). A recipe book with the seeded recipes; open one for ingredients and steps. “Mark as made” decrements matching items from stock.
7. **Sharing** (Profile → Fridges, or the “+” on the Home fridge carousel). Create or rename fridges, invite another user by exact username, and approve join requests. Content in a fridge is visible only to approved members. Hosting a shared fridge requires Pro; being invited to one is free. The demo account has Pro, so all of this is available.
8. **Profile tab.** An **AI credits** card (current balance → the credits screen), subscription status, a **Go Pro** button (and a *Restore purchases* link), **Manage subscription** once subscribed (opens the RevenueCat Customer Center), notification settings, “AI Data & Memory” controls (view and clear what the crew remembers), Sign out, and **Delete account**.

5. Reviewing the in-app purchases (Guidelines 3.1, 3.1.1, 3.1.2)

All purchases are **StoreKit only**, via RevenueCat. There is no external or alternative purchase mechanism anywhere in the app.

5.1 Subscription — ThatFridge Pro

- **Products.** *ThatFridge Pro Monthly* (`thatfridge_pro_monthly`) and *ThatFridge Pro Yearly* (`thatfridge_pro_yearly`). Both are auto-renewable and both include a 7-day free trial.
- **What Pro gives.** A much larger monthly AI-credit bundle (unused credits roll over), and the ability to host a shared fridge for the household. It is *not* a toggle that unlocks locked features — every feature is available on the free tier, subject to the shared AI-credit balance.
- **Opening the paywall.** Profile tab → **Go Pro**; or when the AI-credit balance is exhausted; or when a free user tries to host/share a second fridge.
- **The paywall shows** each plan’s price and billing period, the 7-day free-trial terms and the price after it, a **Restore Purchases** control, the standard auto-renew disclosure, and links to the Terms of Use and Privacy Policy.
- **Sandbox.** Starting the free trial in the review environment grants Pro (and its monthly credit bundle) immediately; no promo code is required. The demo account already has Pro, so no purchase is needed to see Pro features. **Restore Purchases** re-syncs entitlements for the signed-in Apple ID.
- **Cancelling.** Cancelling the trial or subscription (Manage subscription, or iOS Settings) does not remove Pro immediately — access continues until the end of the current period, per Apple’s model, then the app returns to the free tier on the next launch or foreground. Deleting the ThatFridge account likewise does *not* cancel the Apple subscription; that is managed by the user in iOS Settings, and the app says so at the point of deletion.

5.2 Consumables — AI credit packs

- **Products.** `credits_100`, `credits_500` and `credits_1500` — consumable in-app purchases that add exactly 100 / 500 / 1500 AI credits to the account. The amount granted is fixed and disclosed on the purchase button; nothing is randomised. **These are not loot boxes.**
- **Where to buy.** Profile tab → **AI credits**, or the **Get more** link shown under the chat composer / when the balance runs low — this opens the *AI credits* screen, which lists the current balance, what each action costs, and the three packs with their prices.
- **After purchase.** Credits are granted server-side via the RevenueCat purchase webhook and the on-screen balance updates within a few seconds. Consumed credits are spent per AI action and do not expire.
- **Testing.** The demo account already holds a large balance, so credits are not required to exercise any feature. To review the purchase flow itself, use a sandbox Apple ID on the *AI credits* screen.

6. Answers to likely review questions

6.1 Guideline 2.1 — App completeness

The demo account is fully seeded, the production API is live, and every AI feature calls a real service. There are no placeholder screens, debug menus, or “coming soon” features in this build.

6.2 Guideline 4.2 — Minimum functionality (not a web wrapper)

ThatFridge is a native Expo / React Native app. There is *no* web view and no wrapped website. It makes substantive use of native iOS capabilities:

- Camera with its own permission flow (barcode scanning, receipt capture, fridge photos).
- Photo library access (receipt and fridge photos, recipe attachments).

- On-device speech recognition (Apple’s Speech framework, forced on-device — audio never leaves the phone) for voice dictation in chat.
- Local notifications scheduled and delivered on-device for expiry and low-stock reminders.
- Remote push notifications (APNs via Expo) for shared-fridge activity.
- Haptics, gesture-driven drag-and-drop, a native navigation stack, and native modal sheets.
- Sign in with Apple through the native framework.
- StoreKit in-app purchases with a native paywall.

It also provides functionality with no meaningful web equivalent: AI inventory extraction from photographed receipts and fridge contents, multi-user shared-fridge sync, and personalised meal suggestions from the household’s live stock.

6.3 Guideline 4.8 — Login services

The app offers **Sign in with Apple** alongside email/password. Sign in with Apple meets the requirements: data is limited to name and email, it is not used for advertising, and there is no associated tracking.

6.4 Guideline 5.1.1 — Data collection and storage

Collected: account name, username and email; user-created content (items, notes, chat messages); photos the user chooses to attach; subscription status and AI-credit balance (via RevenueCat); an Expo push token; and product-interaction history used to compute the Kitchen Score. **Not collected:** location, contacts, health data, and card/financial data (Apple handles payment). No advertising identifiers, no third-party analytics, no tracking SDKs. The App Privacy section and thatfridge.com/privacy carry the full detail.

6.5 Guideline 5.1.1(v) — Account deletion

Profile tab → **Delete account**, behind a two-step confirmation. This permanently deletes the account and all associated data on the server; owned fridges, items, shopping list, recipes and chat history are removed by database cascade. There is no soft-delete and no hidden retention period — deletion is immediate and irreversible.

6.6 Guidelines 1.2 and 5.1.2 — User-generated content and safety

The only user-generated content is text (fridge names, sticky notes, recipe notes) and chat messages. **None of it is public.** Content in a shared fridge is visible only to members that the fridge owner has explicitly invited and approved; there is no public feed, no content discovery, and no browsing of other users beyond an exact-username search. Safety controls:

- **Block:** a user can block another user from that user’s profile. Blocking is bidirectional and prevents search, invitations and join requests in both directions.
- **Report:** a *Report* action on a profile sends a report to our support team.
- **Contact:** our support address is published in the app and at thatfridge.com/support.

Because sharing is confined to a small, self-selected group, there is no public surface that would require automated content filtering.

6.7 Guideline 2.3 — Accurate metadata

The description, screenshots and keywords describe only features present in this build. The app contains no advertising. “AI crew” refers to the four in-app assistants; every AI response is scoped

to food and the kitchen.

7. Permissions and purpose strings

Every permission is optional — the core inventory workflow functions with all of them denied.

Permission	Requested when	Purpose string shown
Camera	First barcode scan, receipt scan, or fridge photo	“ThatFridge uses the camera to scan barcodes and take photos of receipts and your fridge.”
Photo Library	Attaching a receipt or fridge photo	“ThatFridge lets you attach a photo of your fridge or a receipt to a chat.”
Microphone	First voice dictation in chat	“ThatFridge uses the microphone so you can talk to the chat instead of typing.”
Speech Recognition	First voice dictation in chat	“ThatFridge turns your speech into text for the chat.” (recognition runs on-device)
Notifications	Setting up the first reminder	Expiry and low-stock reminders; shared-fridge activity

8. Third-party services and data flow

Service	Role	Data sent
OpenRouter	LLM inference for chat, and OCR / vision for receipt and fridge-photo scanning	The user’s message or the attached image, plus relevant fridge context. Not used for model training.
fal.ai	Generates a custom food icon from a text prompt	The text prompt only
RevenueCat	Subscription, consumable-purchase and entitlement management	An app-user identifier, purchase status, and the AI-credit balance (mirrored for display)
Expo	Delivers push notifications	The device push token

No other services receive user data. There are no ad networks, analytics SDKs, or data brokers in the app.

9. Contact

Developer	Muhammad Naufal Kamaruddin
Support	thatfridge.com/support — hello@thatfridge.com
Privacy Policy	thatfridge.com/privacy/
Terms of Use	thatfridge.com/terms/
Response time	Within 2 business days

We are glad to provide a screen recording of any specific flow on request.
